

**6.53** (*Function Template maximum*) Write a program that uses a function template called `maximum` to determine the larger of two arguments. Test the program using integer, character and floating-point number arguments.

**6.54** (*Find the Error*) Determine whether the following program segments contain errors. For each error, explain how it can be corrected. [Note: For a particular program segment, it's possible that no errors are present in the segment.]

- a) 

```
template < class A >
int sum( int num1, int num2, int num3 )
{
    return num1 + num2 + num3;
}
```
- b) 

```
void printResults( int x, int y )
{
    cout << "The sum is " << x + y << '\n';
    return x + y;
}
```
- c) 

```
template < A >
A product( A num1, A num2, A num3 )
{
    return num1 * num2 * num3;
}
```
- d) 

```
double cube( int );
int cube( int );
```

**6.55** (*C++11 Random Numbers: Modified Craps Game*) Modify the program of Fig. 6.11 to use the new C++11 random-number generation features shown in Section 6.9.

**6.56** (*C++11 Scoped enum*) Create a scoped `enum` named `AccountType` containing constants named `SAVINGS`, `CHECKING` and `INVESTMENT`.

## Making a Difference

As computer costs decline, it becomes feasible for every student, regardless of economic circumstance, to have a computer and use it in school. This creates exciting possibilities for improving the educational experience of all students worldwide as suggested by the next five exercises. [Note: Check out initiatives such as the One Laptop Per Child Project ([www.laptop.org](http://www.laptop.org)). Also, research "green" laptops—and note the key "going green" characteristics of these devices. Look into the Electronic Product Environmental Assessment Tool ([www.epeat.net](http://www.epeat.net)) which can help you assess the "greenness" of desktops, notebooks and monitors to help you decide which products to purchase.]

**6.57** (*Computer-Assisted Instruction*) The use of computers in education is referred to as *computer-assisted instruction* (CAI). Write a program that will help an elementary school student learn multiplication. Use the `rand` function to produce two positive one-digit integers. The program should then prompt the user with a question, such as

How much is 6 times 7?

The student then inputs the answer. Next, the program checks the student's answer. If it's correct, display the message "Very good!" and ask another multiplication question. If the answer is wrong, display the message "No. Please try again." and let the student try the same question repeatedly until the student finally gets it right. A separate function should be used to generate each new question. This function should be called once when the application begins execution and each time the user answers the question correctly.

**6.58** (*Computer-Assisted Instruction: Reducing Student Fatigue*) One problem in CAI environments is student fatigue. This can be reduced by varying the computer's responses to hold the student's attention. Modify the program of Exercise 6.57 so that various comments are displayed for each answer as follows:

Possible responses to a correct answer:

Very good!  
Excellent!  
Nice work!  
Keep up the good work!

Possible responses to an incorrect answer:

No. Please try again.  
Wrong. Try once more.  
Don't give up!  
No. Keep trying.

Use random-number generation to choose a number from 1 to 4 that will be used to select one of the four appropriate responses to each correct or incorrect answer. Use a switch statement to issue the responses.

**6.59** (*Computer-Assisted Instruction: Monitoring Student Performance*) More sophisticated computer-assisted instruction systems monitor the student's performance over a period of time. The decision to begin a new topic is often based on the student's success with previous topics. Modify the program of Exercise 6.58 to count the number of correct and incorrect responses typed by the student. After the student types 10 answers, your program should calculate the percentage that are correct. If the percentage is lower than 75%, display "Please ask your teacher for extra help.", then reset the program so another student can try it. If the percentage is 75% or higher, display "Congratulations, you are ready to go to the next level!", then reset the program so another student can try it.

**6.60** (*Computer-Assisted Instruction: Difficulty Levels*) Exercises 6.57–6.59 developed a computer-assisted instruction program to help teach an elementary school student multiplication. Modify the program to allow the user to enter a difficulty level. At a difficulty level of 1, the program should use only single-digit numbers in the problems; at a difficulty level of 2, numbers as large as two digits, and so on.

**6.61** (*Computer-Assisted Instruction: Varying the Types of Problems*) Modify the program of Exercise 6.60 to allow the user to pick a type of arithmetic problem to study. An option of 1 means addition problems only, 2 means subtraction problems only, 3 means multiplication problems only, 4 means division problems only and 5 means a random mixture of all these types.
